1. Introduction

1.1 Purpose

The content contained within this document is aimed at capturing and presenting all the requirement specifications for the UberSanté non urgent care scheduling system. The document is intended to be read by the developers of the project and other stakeholders.

1.2 Scope

The UberSanté non urgent care scheduling system is a web application that allows users to make, view, update and cancel non urgent medical appointments. The system will be available to patients, doctors and nurses albeit in different capacities. Patients will have the ability to make, view, modify, update and pay for their own appointments. Nurses will have the ability to make, view, modify and update appointments for any patient. Finally Doctors will be able to use the system to provide their availabilities, as well as view their upcoming appointments.

1.3 Definitions, acronyms, and abbreviations

Term	Definition	
SRS	Software Requirements Specification (this document)	
User	Any person using the system, be it Doctor, Patient or Nurse	
FR	Functional Requirement	
NFR	Non-Functional Requirement	
UC	Use Case	
Reader	A user who wishes to perform a read operation is referred to as a 'reader.' A read operation accesses in order to view (but does not modify) the	

<ubersanté></ubersanté>	Version: 1.4.0

1.5 Overview

The remainder of this document is broken into four sections. Section 2 provides an overall description of the system by describing the product perspective, the product functions, and user characteristics; furthermore, this section supplies any and all constraints, assumptions and dependencies that the system must adhere to. Section 3 details the specific requirements of the system by presenting the functional requirements, and the non-functional requirements of the system. Section 4 provides analysis models that interpret the system requirements such as the use case diagram, Sequence Diagrams, State Diagrams, and the overall Domain Model. Finally, Section 5 lists the Operation Contracts that correspond to the system operations seen in the SSD's.

<ubersanté></ubersanté>	Version: 1.4.0

2. Overall description

2.1 Product perspective

UberSanté is a web application catering to Doctors, Nurses, and Patients. It's main functionalities is to allow patients to book appointments with doctors and to help patients manage their appointments. To be usable, a clinic must be in UberSanté's system. The database for UberSanté will be stored in the clouds using Amazon Web Services (AWS). Information on clinics, doctors, nurses, and patients will be stored in AWS. The application will communicate with the database via the internet.

2.2 Product functions

UberSanté will allow doctors to manage their availabilities as well as to view their appointments. The system also allows patients to book appointments with doctors as well as to manage their appointments. The nurses interacting with the system can help patients book appointments or manage a doctor's appointment. Every availability that is chosen by the patient must be checked out via the cart and paid using a credit card. The database will store all information that is manipulate by the user via UberSanté.

2.3 User characteristics

There are three types of users: Doctors, Nurses, and Patients. Doctors should have a basic knowledge of how to interact with the system. The only knowledge a doctor needs is to input their availabilities in the system as well as to view their availabilities. For nurses, they should have a better understanding of the system because they are able to manipulate appointments for doctors and make appointments for clients. As for clients, basic knowledge of how to interact with the system will be needed to book appointments.

<ubersanté></ubersanté>	Version: 1.4.0	
	Date: 2018-04-11	

2.4 Constraints

The web application is constrained by the server connection, the database capacity and the Internet connection. The server connection is a constraint to the application because it is connected to the database and the Internet connection of the user's device. Without it, the application cannot function entirely.

Additionally, the database capacity is constraint to the application. Since it holds the information users add into the database, queries and requests sent and accepted by the server may increase in time in order to fetch the corresponding data.

Another constraint to the application is the Internet connection. Since the application fetches data from the database over the Internet and the server, is it necessary to have an Internet connection.

2.5 Assumptions and dependencies

It is assumed that the user is capable of reading and understanding the English language, as the UI is written solely in English. Another assumption is that the user is running the web application on a compatible web browser. Many different web browsers are available but it is recommended to use latest versions of Google Chrome, Safari, Internet Explorer or Mozilla Firefox.

It is assumed that the user is running the web application on a compatible operating system. It is only required to be running on Mac OS X, Linux or a later version of Windows XP. It is also assumed that the user has access to an Internet connection strong enough to fetch the information from the database.

3. Specific requirements

3.1 Functional requirements

All functional requirements for the application <Uber Sante> are listed in section 3.1.1 and are organized by feature. Critical requirements are represented by fully dressed use cases in 3.1.2.

3.1.1 Functional requirements

3.1.1.1 User Management

ID: FR1

TITLE: Patient Registration

DESC: The system shall accept patients to register themselves with their health card number, birthday, gender, phone number and physical and email address.

ID: FR2

TITLE: User login

DESC: Given that a user has been registered (either a doctor, nurse or patient), they may log in to the system.

3.1.1.2 Clinic System

ID: FR3

TITLE: Walk-in hours

DESC: Clinic hours are from 8AM until 8PM

ID: FR4

TITLE: Walk-in appointment

DESC: Clinic hours walk-in appointment shall be 20 minutes.

ID: FR5

TITLE: Annual checkup appointment

DESC: Clinic hours annual-checkup appointment shall be 60 minutes.

ID: FR6

TITLE: Medical rooms

DESC: Clinic has a limited number of 5 medical rooms

<ubersanté></ubersanté>	Version: 1.4.0
	Date: 2018-04-11

ID: FR7

TITLE: Number of doctors

DESC: Clinic has a limited number of 7 doctors

3.1.1.3 Booking, Cancelling and Viewing Appointments

ID: FR8

TITLE: Booking Appointment

DESC: While viewing the availabilities of the clinic, the system shall accept a patient or a

nurse to make an appointment

ID: FR9

TITLE: Modifying Appointment

DESC: Nurse and patient can modify existing appointment in the clinic system

ID: FR10

TITLE: Viewing Appointment

DESC: Patient, nurse can patient are able to check an appointment

ID: FR11

TITLE: Cancelling Appointment

DESC: Nurses and patient can cancel an existing appointment in the clinic system

ID: FR12

TITLE: Modifying Appointment

DESC: Nurses and patient can modify existing appointment in the clinic system

ID: FR13

TITLE: Cart System

DESC: Patients shall confirm the booking by going to checkout directly via appointment cart.

ID: FR14

TITLE: Persisted Cart System

DESC: The system shall save the appointment cart for lately use.

ID: FR15

TITLE: Persisted Cart System

DESC: The system shall save the appointment cart for lately use.

ID: FR16

TITLE: Update doctor schedule availability

DESC: The system shall accept registered doctors to update their schedule availability.

<ubersanté></ubersanté>	Version: 1.4.0	
	Date: 2018-04-11	

ID: FR17

TITLE: Schedule Availability for doctors

DESC: The system shall accept registered doctors to complete their schedule availability.

ID: FR18

TITLE: Schedule Walk-in appointment for doctors

DESC: The system shall accept registered doctors to enter 20 minute walk-in appointments.

ID: FR19

TITLE: Schedule Annual appoint for doctors

DESC: The system shall accept registered doctors to enter 60 minute annual checkup appointments.

ID: FR20

TITLE: Schedule Availability for doctors

DESC: The system shall check the availability of doctors and rooms when booking or canceling appointments.

3.1.1.4 Viewing multiple clinics

ID: FR21

TITLE: View clinics info

DESC: The system allows any user to view a clinics open hour, list of doctors and list of nurses affiliated to the clinic.

ID: FR22

TITLE: Admin registration

DESC: The system allows an admin to register for a doctor or a nurse.

ID: FR23

TITLE: Doctor and nurse clinic change

DESC: The system allows an admin to change and to assign a clinic for a doctor or a nurse.

<ubersanté></ubersanté>	Version: 1.4.0
Software Requirements Specification	Date: 2018-04-11

3.2 Use Cases of Critical Features

Use Case UC1	Book an Appointment
Related to	FR8
Primary Actor	Patient, Nurse
Stakeholder and Interests	Patient and nurse can book an annual or a walk-in appointment
Preconditions	The patient does not have more than 1 annual appointment to book an annual appointment.
Postconditions	The appointment is booked through a doctor's availability
Basic flow (main success)	 Patient clicks on "Book an appointment" Patient chooses "Walk-in" or "Annual" Patient clicks on an availability Patient view summarized appointment and confirms booking Patient clicks on "Cart" Patient presses checkout
Alternative flow	 Nurse chooses a health card number for a patient Nurse clicks on "Book an appointment" Nurse chooses "Walk-in" or "Annual" Nurse clicks on an "Book" Nurse view summarized appointment and confirms booking
Priority	High

Use Case UC2	Patient Update Appointment
Related to	FR12

<ubersanté></ubersanté>	Version: 1.4.0	
	Date: 2018-04-11	

Primary Actor	Nurse, Patient
Stakeholder and Interests	Nurse and Patient can update their appointment to a new time
Preconditions	Patient or Nurse needs to be logged in and have an appointment currently booked
Postconditions	The appointment has a new booking time. The past appointment is now canceled.
Basic flow (main success)	 Patient clicks on the appointment he wants to update Patient navigates through the calendar Patient clicks a date for their new appointment Patient confirms their new appointment Nurse picks a patient Nurse clicks on the appointment she wants to update Nurse navigates through the calendar Nurse clicks a date for their new appointment Nurse confirms their new appointment
Alternative flow	 Patient clicks on the appointment he wants to update Patient navigates through the calendar Patient does not find any other date for his appointment Patient keeps his current appointment Patient cancels his current appointment
Priority	High

Use Case UC3	Patient Cancel Appointment
Related to	FR11
Primary Actor	Nurse, Patient
Stakeholder and Interests	Nurse and Patient can cancel current appointments.
Preconditions	Nurse or Patient is logged in.
Postconditions	The appointment is canceled. The availability at that time is now

<ubersanté></ubersanté>	Version: 1.4.0
	Date: 2018-04-11

	available.
Basic flow (main success)	 Patient clicks on the appointment he wants to cancel. Patient confirms the cancel.
	 Nurse picks a patient Nurse clicks on the appointment she wants to cancel Nurse confirms the cancel
Alternative flow	
Priority	High

Use Case UC4	Doctor Updates Availability
Related to	FR13, FR14, FR15, FR16
Primary Actor	Doctor
Stakeholder and Interests	Doctor: is able to update his availabilities in the system.
Preconditions	Doctor needs to be logged into the system.
Postconditions	Doctors availabilities are updated.
Basic flow (main success)	 Doctor navigates to "My Availabilities". Presses the "+" (add) button and selects walk-in or annual checkup. System prompts Doctor to input starting day and time. Doctor presses "Apply" System registers new availability and displays result in Doctor's calendar. Doctor presses on a specific availability on the calendar if he/she wishes to update it or delete it. System prompts Doctor to change starting day and time or to remove the event. System updates availability based on selected option.
Alternative flow	4.a) System rejects availability since it overlaps with another one.4. b) system rejects availability since it's outside clinic hours

<ubersanté></ubersanté>	Version: 1.4.0
Software Requirements Specification	Date: 2018-04-11

Priority	High

3.3 Non-functional requirements

3.3.1 Business Rules

ID: NFR1

Title: Patient minimum age

DESC: Registered patients should be over 18 years of age.

ID: NFR2

Title: Payment method

DESC: Credit card is the only acceptable payment method.

ID: NFR3

Title: Annual checkup limit

DESC: The system accepts only one annual checkup appointment per patient.

ID: NFR4

Title: Walk-in limit

DESC: The system accepts an unlimited number of walk-in appointments per patient.

3.3.2 Concurrency Properties

ID: NFR5

TITLE: Shared Resource Safety 1

DESC: A shared resource must not be simultaneously accessed by a writer and reader.

ID: NFR6

TITLE: Shared Resource Safety 2

DESC: A shared resource must not be simultaneously accessed by more than one writer.

ID: NFR7

TITLE: Shared Resource Liveliness

DESC: Users who wish to obtain access to a shared resource will eventually be allowed access.

<ubersanté></ubersanté>	Version: 1.4.0
	Date: 2018-04-11

ID: NFR8

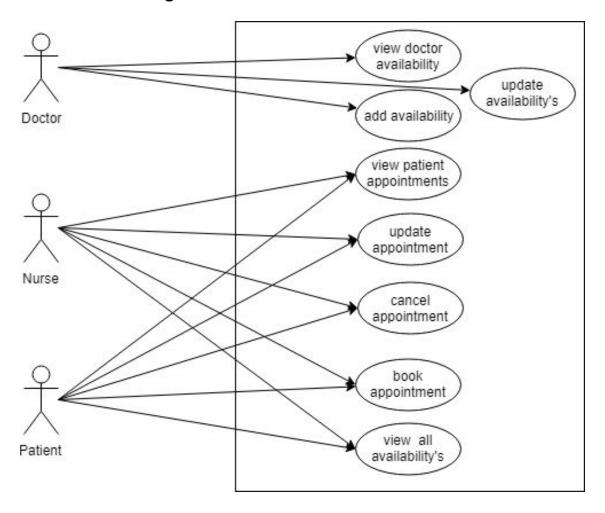

TITLE: Shared Resource Fairness

DESC: Requests for access must succeed infinitely often. No user will wait forever to be serviced. Furthermore, in this system we want writers to have priority over readers.

5. Operation Contracts

Contract C1: bookAppointment

Operation: bookAppointment(user, cart, payment)

Cross References: UC1, SSD1

Preconditions: Patient or Nurse needs to be logged in and the patient must not have more

than 1 annual appointment to book an annual appointment.

Postconditions: The appointment has been booked. Availability is now occupied.

Contract C4: updateAppointment

Operation: updateAppointment(user, time)

Cross References: UC4, SSD4

Preconditions: Patient or Nurse needs to be logged in and have an appointment currently

booked

Postconditions: The appointment has a new booking time. The past appointment is now

canceled.

<ubersanté></ubersanté>	Version: 1.4.0
	Date: 2018-04-11

Contract C5: cancelAppointment

Operation: cancelAppointment(user, time)

Cross References: UC5, SSD5

Preconditions: Nurse or Patient is logged in and have an appointment currently booked

Postconditions: The appointment is canceled. The availability at that time is now available

for other users.

Contract C6: addAvailability

Operation: addAvailability(Availability)

Cross References: UC6, SSD6

Preconditions: Availability is within clinic operating hours and availability doesn't conflict

with pre-existing availabilities

Postconditions: New availability is persisted
